Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.

In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.

It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do--fully clean up the site.

In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.

It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do--fully clean up the site.

Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.

Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.

In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.

It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do--fully clean up the site.

But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.

It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do--fully clean up the site.

Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.

In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.

Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.

In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.

It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do--fully clean up the site.

People are ill and dying because of this contamination. This contamination that causes cancer has killed children in the area. I will never support the space program ever again.

In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.

It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do--fully clean up the site.

Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.

Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.

In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.

It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do--fully clean up the site.

But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.

It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do--fully clean up the site.

Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.

In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.

Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.

In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.

It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do--fully clean up the site.

But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.

It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do--fully clean up the site.

Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.

In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.

Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.

In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.

It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do--fully clean up the site.

Over decades, NASA contaminated the Santa Susana Field Lab with dioxins, PCBs, perchlorate, heavy metals, TCE and other volatile organic compounds. Hundreds of thousands of people live nearby. A federal study showed that people living closer to the site have higher rates of thyroid, bladder, blood and lymph cancers than people living further away.

In 2010, NASA signed a legally binding agreement with California to clean up all contamination that could be detected. But Boeing, NASA's contractor at the site and owner of most of the site, has been pushing to block full cleanup of most of the site. The Draft Environmental Impact Statement recently released by NASA that barely mentions the contamination raises questions about whether NASA is trying to break out of the cleanup agreement it signed.

It is critical that NASA live up to the commitments it made in the 2010 cleanup agreement. I strongly urge NASA to meet its responsibilities regarding the toxic contamination it created. Do what you promised to do--fully clean up the site.
